PROFESSIONAL SUMMARY

I am a B.Tech Artificial Intelligence & Data Science student at Vimal Jyothi Engineering College (2024-2028, CGPA 8.65) with hands-on project experience in machine learning, natural language processing, big data processing, and data-driven applications. I enjoy turning ideas into working experiments, simulations, and practical tools. I focus on clean implementation, careful experimentation, and responsible model evaluation.

I build primarily in Python and Jupyter. My GitHub shows **255 commits across 25 repositories** and roughly **21,800 lines of code** produced in 2026. Key projects include:
- **Credit card fraud detection:** I handled class imbalance using SMOTE and Random Forest.
- **Sentiment analysis at scale:** I processed about 1.6 million tweets with Apache Spark/PySpark.
- **3-DOF robotic arm simulator:** I built an interactive forward kinematics simulator.
- **Travel-timing recommendation prototype:** I combined a FastAPI backend with weather and route data.

My work also covers computer vision (CNNs with TensorFlow/Keras), clustering, recommendation systems, and chatbot development with Streamlit.

I am currently moving from building individual models toward building complete intelligent systems. This includes API-driven applications, agent-based simulation, and robotics. I am seeking internship opportunities in AI/ML engineering, data science, or software development. I want to contribute to real-world problems while deepening my skills in scalable ML pipelines, LLM applications, and autonomous systems.

PROFESSIONAL EXPERIENCE

Independent AI & Data Science Project Developer | Self-Directed Project Portfolio | January 2026 - Present

I design, build, and document end-to-end machine learning, NLP, simulation, and web projects alongside my B.Tech coursework. Across 25 public repositories, I have produced 255 commits. Each project includes structured documentation, result visualizations, and reproducible notebooks or scripts.

Key Projects and Contributions:
- **Machine Learning and Predictive Analytics:**
- I built a fraud detection pipeline on an imbalanced transaction dataset (FraudShield AI, 20 commits).
